### Owner's details

|        |                |
|--------|----------------|
| Name : | Scott Brennand |
|--------|----------------|

### Animal's Details

|                       |                     |
|-----------------------|---------------------|
| Registered Name :     |                     |
| Pet Name :            | Mirko               |
| Registration Number : |                     |
| Breed :               | Australian Shepherd |
| Microchip Number :    | 982000411507039     |
| Sex :                 | Male                |
| Date of Birth :       | 16th Nov 2017       |
| Colour :              | Blue Merle          |

### Sample Collection Details

|                       |          |
|-----------------------|----------|
| Case Number :         | 20K11090 |
| Collected By :        | DM4128   |
| Approved Collection : | YES      |
| Sample Type :         | SWAB     |

### Test Details

|                  |  |
|------------------|--|
| Test Requested : | Australian Shepherd – Full Breed Profile |
| Pet Name :       | Mirko                                    |
| Date of Test :   | 29th Apr 2020                            |

### Authorisation

Sample with Lab ID Number 20K11090 was received at Orivet Genetics, DNA was extracted and analysed with the following result reported:

  
.....

George Sofronidis BSc (Hons)

  
.....

Dr Noam Pik BVSc, MAVS

### Animal's Details

|                       |                     |
|-----------------------|---------------------|
| Registered Name :     |                     |
| Pet Name :            | Mirko               |
| Registration Number : |                     |
| Breed :               | Australian Shepherd |
| Microchip Number :    | 982000411507039     |
| Sex :                 | Male                |
| Date of Birth :       | 16th Nov 2017       |
| Colour :              | Blue Merle          |

### Tests Reported

| Diseases  | Result  |
|---|---|
| Collie Eye Anomaly/Choroidal Hypoplasia                     | CARRIER [ONE COPY OF THE VARIANT DETECTED]                        |
| Degenerative Myelopathy                                     | NEGATIVE / CLEAR [NO VARIANT DETECTED]                            |
| Hyperuricosuria   | NEGATIVE / CLEAR [NO VARIANT DETECTED]                            |
| Ivermectin Sensitivity MDR1 (Multi Drug Resistance)         | POSITIVE HOMOZYGOUS [TWO COPIES OF THE DOMINANT VARIANT DETECTED] |
| Multifocal Retinopathy CMR1 (Mastiff/Bull Breeds Type)      | NEGATIVE / CLEAR [NO VARIANT DETECTED]                            |
| Neuronal Ceroid Lipofuscinosis 6 (Australian Shepherd Type) | NEGATIVE / CLEAR [NO VARIANT DETECTED]                            |
| Progressive Rod Cone Degeneration (prcd) - PRA              | NEGATIVE / CLEAR [NO VARIANT DETECTED]                            |

| Traits                                | Result  |
|---------------------------------------|---|
| E Locus - (Cream/Red/Yellow)          | E/E - DOMINANT BLACK DOES NOT CARRY YELLOW/RED/WHITE  |
| E Locus (Cattle Dog Cream Variant) e2 | E <sup>2</sup> /E <sup>2</sup> - DOMINANT BLACK DOES NOT CARRY "AUSTRALIAN CATTLE DOG" TYPE CREAM |
| Brown (345DELP) Deletion              | B <sup>d</sup> /B <sup>d</sup> - DOES NOT CARRY BROWN/RED/LIVER or CHOCOLATE [DELETION]           |

Owner's Name : Scott Brennand

Pet Name : Mirko

Microchip Number : 982000411507039

Approved Collection Method: ☒ Yes

### Tests Reported

| Traits                                  | Result   |
|---|--|
| Brown (GLNT331STOP) Stop Codon          | B <sup>s</sup> /B <sup>s</sup> - DOES NOT CARRY BROWN/RED/LIVER or CHOCOLATE [STOP CODON]          |
| Brown (SER41CYS) Insertion Codon        | B <sup>c</sup> /b <sup>c</sup> - CARRIER OF BROWN/LIVER/RED/CHOCOLATE [INSERTION]                  |
| D (Dilute) Locus                        | D/D - NO COPY OF MLPH-D ALLELE (DILUTE) - PIGMENT IS NORMAL  |
| K Locus (Dominant Black)                | k <sup>y</sup> /k <sup>y</sup> - RECESSIVE NON- BLACK [COLOUR PATTERN DETERMINED BY A LOCUS]       |
| A Locus (Fawn/Sable/Tri/Tan Points)     | a <sup>t</sup> /a <sup>t</sup> - TAN POINTS/BLACK & TAN or TRICOLOUR MAY BE BRINDLED [SEE K LOCUS] |
| Long Hair Gene (Canine C95F)            | POSITIVE - SHOWING THE PHENOTYPE   |
| Natural Bob Tail (Short Tail Phenotype) | POSITIVE - SHOWING THE PHENOTYPE   |

**Owner's Name :** Scott Brennand

**Pet Name :** Mirko

**Microchip Number :** 982000411507039

**Approved Collection Method:**  Yes

# Glossary of Genetic Terms (Results)

The terms below are provided to help clarify certain results phrases on your genetic report. The phrases below are those as reported by Orivet and may vary from one laboratory to the other.

## **NEGATIVE / CLEAR [NO VARIANT DETECTED]**

No presence of the variant (mutation) has been detected. The animal is clear of the disease and will not pass on any disease-causing mutation.

## **CARRIER [ONE COPY OF THE VARIANT DETECTED]**

This is also referred to as HETEROZYGOUS. One copy of the normal gene and copy of the affected (mutant) gene has been detected. The animal will not exhibit disease symptoms or develop the disease. Consideration needs to be taken if breeding this animal - if breeding with another carrier or affected or unknown then it may produce an affected offspring.

## **POSITIVE / AT RISK [TWO COPIES OF THE VARIANT DETECTED]**

Two copies of the disease gene variant (mutation) have been detected also referred to as HOMOZYGOUS for the variant. The animal may show symptoms (affected) associated with the disease. Appropriate treatment should be pursued by consulting a Veterinarian.

## **POSITIVE HETEROZYGOUS [ONE COPY OF THE DOMINANT VARIANT DETECTED]**

Also referred to as POSITIVE ONE COPY or POSITIVE HETEROZYGOUS. This result is associated with a disease that has a dominant mode of inheritance. One copy of the normal gene (wild type) and affected (mutant) gene is present. Appropriate treatment should be pursued by consulting a Veterinarian. This result can still be used to produce a clear offspring.

## **NORMAL BY PARENTAGE HISTORY**

The sample submitted has had its parentage verified by DNA. By interrogating the DNA profiles of the Dam, Sire and Offspring this information together with the history submitted for the parents excludes this animal from having this disease. The controls run confirm that the dog is NORMAL for the disease requested.

## **NORMAL BY PEDIGREE**

The sample submitted has had its parentage verified by Pedigree. The pedigree has been provided and details (genetic testing reports) of the parents have been included. Parentage could not be determined via DNA profile as no sample was submitted.

## **NO RESULTS AVAILABLE**

Insufficient information has been provided to provide a result for this test. Sire and Dam information and/or sample may be required. This result is mostly associated with tests that have a patent/license and therefore certain restrictions apply. Please contact the laboratory to discuss.

## **INDETERMINABLE**

The sample submitted has failed to give a conclusive result. This result is mainly due to the sample failing to "cluster" or result in the current grouping. A recollection is required at no charge.

## **DNA PROFILE**

Also known as a DNA fingerprint. This is unique for the animal. No animal shares the same DNA profile. An individual's DNA profile is inherited from both parents and can be used for verifying parentage (pedigrees). This profile contains no disease or trait information and is simply a unique DNA signature for that animal.

# Glossary of Genetic Terms (Results)

The terms below are provided to help clarify certain results phrases on your genetic report. The phrases below are those as reported by Orivet and may vary from one laboratory to the other.

## **PARENTAGE VERIFICATION/ QUALIFIES/CONFIRMED Or DOES NOT QUALIFY/EXCLUDED**

Parentage is determined by examining the markers on the DNA profile. A result is generated and stated for all DNA parentage requests. Parentage confirmation reports can only be generated if a DNA profile has been carried out for Dam, Offspring and possible Sire/s.

## **PENDING**

Results for this test are still being processed. Some tests are run independently and are reported at a later date. When completed, the result will be emailed. APPROVED COLLECTION METHOD (NO) The sample submitted for testing HAS NOT met the requirements recommended by member bodies for the DNA collection process.

## **TRAIT (PHENOTYPE)**

A feature that an animal is born with (a genetically determined characteristic). Traits are a visual phenotype that range from colour to hairlength, and also includes certain features such as tail length. If an individual is AFFECTED for a trait then it will show that characteristic eg. AFFECTED for the B (Brown) Locus or bb will be brown/chocolate.

## **POSITIVE – SHOWING THE PHENOTYPE**

The animal is showing the trait or phenotype tested.

## **CLARIFICATION OF GENETIC TESTING**

The goal of genetic testing is to provide breeders with relevant information to improve breeding practices in the interest of animal health. However, genetic inheritance is not a simple process, and may be complicated by several factors. Below is some information to help clarify these factors.

The goal of genetic testing is to provide breeders with relevant information to improve breeding practices in the interest of animal health. However, genetic inheritance is not a simple process, and may be complicated by several factors. Below is some information to help clarify these factors.

- 1) Some diseases may demonstrate signs of what Geneticists call "genetic heterogeneity". This is a term to describe an apparently single condition that may be caused by more than one mutation and/or gene
- 2) It is possible that there exists more than one disease that presents in a similar fashion and segregates in a single breed. These conditions – although phenotypically similar – may be caused by separate mutations and/or genes.
- 3) It is possible that the disease affecting your breed may be what Geneticists call an "oligogenic disease". This is a term to describe the existence of additional genes that may modify the action of a dominant gene associated with a disease. These modifier genes may for example give rise to a variable age of onset for a particular condition, or affect the penetrance of a particular mutation such that some animals may never develop the condition.

The range of hereditary diseases continues to increase and we see some that are relatively benign and others that can cause severe and/or fatal disease. Diagnosis of any disease should be based on pedigree history, clinical signs, history (incidence) of the disease and the specific genetic test for the disease. Penetrance of a disease will always vary not only from breed to breed but within a breed, and will vary with different diseases. Factors that influence penetrance are genetics, nutrition and environment. Although genetic testing should be a priority for breeders, we strongly recommend that temperament and phenotype also be considered when breeding.

Orivet Genetic Pet Care aims to frequently update breeders with the latest research from the scientific literature. If breeders have any questions regarding a particular condition, please contact us on (03) 9534 1544 or [admin@orivet.com](mailto:admin@orivet.com) and we will be happy to work with you to answer any relevant questions.
